

A cross-sectional view of a substrate 2. A layer 4 is formed on the top surface of the substrate 2. This layer 4 contains a series of protrusions 10. The layer 4 is divided into two regions: a left region with diagonal hatching and a right region with a solid white fill. The protrusions 10 are located in the hatched region and extend upwards from the surface of the substrate 2. A label 12 points to the boundary between the two regions of layer 4.
